858-722-8132

Summary

Technical Leader with 12+ years building and enabling enterprise business solutions. Currently serving as startup CTO while maintaining strategic architecture role. Led teams delivering multi-million dollar operational savings. Expert in AWS, Azure, GCP. Available immediately to assist organizations achieve desired business outcomes.

Experience

ViaSkill (Remote)

CTO & Co-Founder (01/2025 Present)

- Architected multi-tenant SaaS platform using Firebase ecosystem with Google Document AI and Vertex AI integration
- Led technical presentations to investors, mentors, and strategic partners, translating complex architectures into business impact narratives
- Implemented Google Document AI for resume parsing and Vertex AI/Gemini 2.0 for content generation with fallback mechanisms and prompt engineering
- Established engineering standards, deployment procedures, and SOC2-compliant security protocols
- Built and managed distributed engineering team across frontend, backend, and QA functions
- Designed subscription monetization model and implemented Stripe-based payment infrastructure supporting 5 pricing tiers
- Managed monthly burn rate and infrastructure costs, achieving full platform operation at minimal costs
- Participated in investor pitch meetings, providing technical feasibility assessments and development timeline estimates
- Evaluated competitive landscape, analyzing 20+ competing platforms for technical differentiation opportunities
- Established technical hiring pipeline, interviewed contractor candidates, and managed vendor selection process
- Defined product roadmap technical constraints and resource requirements for feature prioritization decisions
- Conducted build-vs-buy analysis for core platform capabilities, selecting optimal vendor solutions
- Led technical due diligence sessions with potential B2B enterprise clients and strategic partners

- Coordinated with co-founders on product-market fit iterations based on technical feasibility
- Developed technical documentation for investor due diligence and partnership discussions
- Managed relationships with technical vendors (Stripe, SendGrid, GCP, careerjet) including contract negotiations
- Directed platform migration strategy from MVP to scalable architecture to support enterprise-level load and scalability

Tandem Diabetes Care, Inc. (San Diego, Remote from Japan)

Principal Software Engineer (6/2020 – 12/2024)

- Led team of 7 senior engineers in architecting enterprise solutions and implementing platform engineering and application/feature solutions; focusing on scalable, efficient architectures and improving data acquisition and processing workflows based on requirements recognized and given by the business, and/or identified as being a high-value/high-beneficial impact deliverable/project.
- Reduced critical safety test execution from 2 hours to 10 minutes, improving productivity for 200+ developers, accelerating product release cycles to market
- Built and deployed AI-Driven Solutions, including:
 - **Human Operator Emulation:** Automated interactions with legacy systems to extend usability and reduce manual workload.
 - **Large Dataset Summarization:** Achieved 98% confidence in log analysis, enhancing support case resolution efficiency and customer service reliability.
- Employed Python,(with flask for API development) Bash, and PowerShell for automation and scripting, driving consistent and maintainable solutions.
 - Examples:
 - SSL/TLS Certificate and DNS record management self-service portal
 - Platform-agnostic VM deployment self-service portal
 - Permissions Elevation Automation for qualified/approved personnel self-service portal (audit trail sent to cyber-security)
 - Password Rotation Automation Registry self-service portal for rotating passwords for application service accounts
 - Vulnerability state management tool integrating tenable and Jira for Simplified and streamlined assignment of vulnerability resolution tasks to appropriate teams
- Modernized legacy customer support application stack serving 400K+ active users written in JavaScript (Node.js, Angular), supporting document revision repositories for customer support teams.
- Developed Web APIs using Python and Flask, adhering to a container-first approach and integrating RabbitMQ for retry logic and performance scaling.
- Orchestrated Containerized Services on Kubernetes, utilizing Consul service mesh for disaster recovery and failover tolerance.
- Managed Cloud Migrations, transitioning workloads to Azure using Terraform Enterprise for the infrastructure-as-code solution using drift detection,(As part of a process to prevent manual edits to the infrastructure that have not been pushed in code) ensuring security and scalability.
- Streamlined CI/CD Pipelines by integrating Jenkins into source control (GitHub Enterprise in cloud, Bitbucket on prem) to improve deployment speed, reliability, and efficiency.

- Integrated Secrets Management and Security Automation (secure-introduction/secrets-injection workflows) into CI/CD pipelines using HashiCorp Vault, ensuring secure deployments and reducing operational risks. Organization-wide monthly IaaS image-build SDLC with Packer, and collaborated with other component/feature teams as necessary to ensure consistency/compliance (Windows 2012r2-2019 Core, Ubuntu 18.04, 20.04, 22.04, 24.04) Linux/Windows unattended install configuration management for image preparation
 - Post OS-installation build workflows to run further configuration of required products and creation of image artifacts (Packer, Bash/PowerShell, Jenkins build)
 - Importing image artifacts into Hyper-V, and Azure, Nutanix
 - Certification of image: running unit tests before promotion to upper environments & enablement in prod content library (Dev -> Staging -> Prod)
 - Design and architecture of services, focusing team resources on priority deliverables using Agile methodologies (sprints, stories, epics, story points, standups, retrospectives etc)
 - Migration of legacy applications to cloud deployments, using infrastructure-as-code
 - (Terraform/Docker/Kubernetes), containerized deployments for microservices and modern applications
- Design and deployment of data aggregation service (server, network/vulnerability scans, application, and Identity Management metrics) to design in MongoDB with neo4j as the presentation layer, and integrations to data sources being written in Python and Go, and deployed via our CI/CD pipelines
- Resolution of escalated support requests from surrounding business units

Wells Fargo Bank (Remote)

DevOps Engineer Private Cloud Enablement/IaaS Compute Engineering (6/2018 – 12/2019)

- Architected enterprise IaaS platform supporting 50,000+ employees globally, and collaborated with other component/feature teams as necessary to ensure consistency/compliance (Windows 2012r2-2019 Core, RHEL 6.9/7.4)
 - Bash Script/Microsoft MDT workflows for image preparation and OS/required product Installation in vCenter (Control Plane)
 - Post OS-installation build workflows to run further configuration of required products and creation of image artifacts (Bash/PowerShell, Jenkins build)
 - Importing image artifacts into Openstack (Management Plane)
 - Certification of image: running unit tests before promotion to upper environments (Dev -> Staging -> Prod)
- Incorporation and subsequent automation of new processes into IaaS provisioning workflows for provisioning into customer (business unit) private cloud environments as product (commercial/FOSS) certification policies permitted (PowerShell, Bash, Python)
- Created image-build orchestration pipeline process in vRealize code stream (bash/PowerShell/REST API calls) to streamline/automate image creation
- Collaboration with security teams to create new groups and service accounts and remove/modify those existing as part of a least-permissions approach to implementing processes and functionality
- Resolved critical production incidents impacting \$2B daily transaction volume and running regression tests in lower environments. (bootstraps, (cloudbase-init, cloud-init) fixes in

product configuration puppet manifests, (Infoblox, RSA authentication agent, BoKS), and other prerequisite configuration scripts for IaaS provisioning processes

- Led cross-functional initiatives with Security, Network, and Platform teams (example: Firewall/network/security, Linux Build Engineering, Windows Build Engineering, Puppet Automation/Engineering) as needed to ensure IaaS provisioning process quality/consistency
- Resolution of escalated support requests from surrounding business units

Intuit, Inc. (Contractor, Remote)

Senior DevOps Engineer (8/2018 – 6/2019)

- Reduced AWS operational costs 40% through Lambda optimization and infrastructure right-sizing
- Decreased deployment time 75% (4 hours to 1 hour) through CI/CD pipeline automation
- Prevented 15+ monthly production incidents via proactive monitoring implementation
- Re-evaluating and implementing optimized Deployment/Code Coverage/CI processes with collaboration from software developers, and Staff Engineers. (Jenkins integration to GitHub enterprise, and AWS CodePipeline to handle resultant artifact build from Jenkins and subsequent orchestration/deployment operations)
- Configured and implemented PagerDuty workflows, and leveraged CloudWatch metrics alarm configuration for this integration
- Splunk integration with Amazon Kinesis Data Firehose for all lambda functions in prod
- Assisting software developers resolve code issues impacting production (Java)
- Orchestration of infrastructure/architecture using organization-approved patterns in AWS CloudFormation (VPC, Private/Public Subnets, NAT Gateways)
- Orchestration/Configuration of resources using AWS Cloudformation (Lambda Functions, EC2 Autoscaling using CloudWatch metrics/alarms, spot-instance launch configurations, DynamoDB, IAM Users, IAM Roles/Managed policies, EC2 Instances, Security Groups, KMS, s3, Cloudformation stack export values for cross-stack referencing)
- Design and implement solutions to automate tasks and improve monitoring using Bash and Python
- Amazon AWS resource config optimization, EC2 instance Linux config orchestration (CentOS, Redhat) through code deployment, cloud-init/cfn-init bootstrapping.
- Integrating Checkmarx, and Sonatype IQ Server into build processes to align with organization-wide code coverage security practices and requirements
- Optimization and tuning of Amazon Lambda Functions to achieve desired performance outcomes while aligning with business requirements and minimizing cost
- Resolution of escalated support requests from surrounding business units

GreatCall, Inc.

Cloud Operations Engineer (4/2017 – 3/2018)

- Lead and managed the initiative to migrate on-prem workloads to AWS. Re-evaluating DevOps/CI processes with collaboration from software developers, and DevOps engineers
- Dynamic provisioning of resources (IAM Users, IAM Managed policies, VPC, EC2/RDS Instances, Security Groups, ELB, s3, Cloudformation stack export values for cross-stack referencing) using Cloudformation to bootstrap immutable compute resources.
- Implementation of new Puppet master to deploy applications/desired state configuration to clustered and singleton services in AWS environments in Production, Staging, and

development environments. Along with the leveraging of custom facts, and refactoring of manifests to facilitate promotion from development (on-prem datacenter) into staging and production environments.

- Amazon AWS EC2, RDS, S3 maintenance and administration, Linux Administration (CentOS, Redhat)
- Design and implement solutions to automate tasks and improve monitoring using primarily PowerShell, Bash, Python, JSON, YAML, Puppet and Ansible resource abstraction layers.
- Refine build processes to further enable continuous artifact based deployment. Used bitbucket webhooks to integrate with Jenkins, and execute pipeline build jobs, respective to the repository where code changes had been committed.
- Containerization of workloads where possible. (IBM messagesight, Elastic Stack, Consul, Redis, (for Sensu) WordPress)
- Client-side Production and Test Environment Microsoft SQL server (2005-2017) administration
- VMWare vCenter Administration for on-prem systems
- Resolution of escalated support tickets from other product teams

Education Systems, Inc.

DevOps Engineer (11/2012 – 4/2017)

- Established DevOps practices reducing deployment time from 8 hours to 30 minutes
- Utilizing Amazon Route53 and ELB to minimize downtime in a 24/7 high-availability environment.
- Implementation of Ansible to manage AWS environments and automate the build process for clustered (15-25 servers in each environment taking 1000+ requests per minute) Production, Staging, and development environments – as well as subsequent configuration tasks
- Redesign build processes to allow for continuous artifact based deployment.
- Amazon AWS EC2, RDS, S3 maintenance and administration, Linux Administration (CentOS, Redhat)
- Design and implement solutions to automate tasks and improve monitoring using primarily PowerShell, Bash, Python.
- New client implementation/migration and go-live into Cloud-hosted Citrix XenApp 6 environment
- Client-side Production and Test Environment Microsoft SQL server (2005-2014) administration
- Overall management of onsite and offsite backup strategies
- Maintenance and Administration tasks of SaaS product on CentOS, tomcat, and MySQL
- Active Directory configuration/administration
- Server and Network hardware installation and maintenance
- VMWare ESXi Host Implementation, Administration, and Backup
- Managing Group Policy and Windows Update Policy using WSUS
- Submission of bug reports and enhancement requests to our task management system
- Resolution of escalated support tickets

Skills

- 20+ years of progressive freelance technology solutions consultancy, support, and implementation
- Alignment of solutions with business process with the goal of streamlining or augmentation
- Orchestration/Configuration Management: [Ansible, Puppet, AWS CDK, Azure ARM, Azure Bicep, AWS Cloudformation, Terraform]
- Virtualization Environments : [Nutanix], [OpenStack – Glance, Cinder, Nova, Keystone, Horizon, Neutron], [VMware – vCenter, NSX, vRealize Automation, vRealize Code Stream], [Vagrant], [Proxmox], [Virtual Box]
- Containers (Docker, Kubernetes, Azure Kubernetes Service (AKS), Azure Container Registry(ACS),AWS Fargate, Amazon ECS, Amazon ECR (container registry))
- Citrix XenApp 4, 6, and 7 Administration and implementation
- Software environment design and implementation (Production/Test/Staging)
- Windows & Linux System Administration (CentOS, RedHat, Ubuntu)
- Windows XP 10 & Windows Server 2003-2022 running Active Directory/Domain/DNS Configurations.
- Microsoft SQL server 2003-2022, mongodb, Cockroach DB, PostgreSQL, MariaDB and MySQL
- Rabbit MQ, Apache Kafka, IBM MQTT
- AWS Architecture/environment design, implementation in line with best-practices and administration (Ansible, Puppet, Cloudformation, AWS CDK, Terraform)
- Azure Architecture/environment design, implementation in line with best-practices and administration (Ansible, Puppet, Cloudformation, Azure ARM/Bicep, Terraform)
- bash, PowerShell, PHP, MySQL, MSSQL, XML, HTML, XHTML, CSS, Python, Golang, Java, TypeScript, git, SVN source control systems

Additional Capabilities:

- Business Japanese
- Multi-cloud architecture and migration experience
- Production incident response and development/operations coverage outside US business hours from Japan
- General understanding of ERP Systems, their development cycles, and implementations
