PROFESSIONAL SUMMARY

Senior Network & Data Platform Program Manager with 18+ years of experience leading large-scale network observability, telemetry analytics, and AI-driven operational intelligence programs across enterprise environments. Proven expertise delivering real-time monitoring platforms, streaming data ecosystems, and production-grade alerting frameworks for wired and wireless infrastructures.

Strong background in network instrumentation, event-driven architectures, incident response leadership, and reliability engineering. Experienced in translating telemetry data into actionable dashboards, intelligent alerting strategies, and measurable improvements in uptime, MTTR, and operational efficiency.

CORE TECHNICAL EXPERTISE**Network & Telemetry Systems**

- Network telemetry architecture and instrumentation
- SNMP-based monitoring and device event collection
- Network/Element Management system integrations
- Layer 2 / Layer 3 switching, routing, VLANs, RF optimization
- Infrastructure health metrics and operational analytics

Streaming & Data Platforms

- Real-time streaming ingestion (Apache Kafka ecosystem)
- Event-driven data pipelines
- Time-series data platforms and performance metrics
- SQL-based analytics and data validation
- Snowflake, DB2 modernization programs

Observability & Monitoring

- Splunk and ELK-based log analytics and search optimization
- Dashboard development and executive reporting
- Alert correlation logic and noise reduction
- Incident triage and production troubleshooting
- Root Cause Analysis (RCA) and runbook improvements

AI / Automation

- Anomaly detection models for infrastructure monitoring
- Predictive diagnostics and performance baselining
- ML lifecycle governance and KPI tracking
- Python-based automation and scripting
- Auto-remediation workflows

PROFESSIONAL EXPERIENCE

VENTURA FOODS | Irvine, CA | Senior Program Manager – Data, Network & AI Platforms August 2024 – Present

- Led \$3.5M enterprise modernization initiative migrating legacy DB2 systems to Snowflake while enabling real-time operational analytics.
- Established telemetry-driven monitoring framework connecting infrastructure data, business metrics, and executive dashboards.
- Designed data validation and quality controls for high-volume streaming ingestion pipelines.
- Built executive observability dashboards integrating performance KPIs, infrastructure metrics, and risk indicators.
- Partnered with operations teams to streamline production troubleshooting workflows, improving incident response coordination.
- Delivered 25% improvement in data accuracy and reduced duplicate system overhead.
- Led enterprise wired and wireless network modernization initiatives including switching upgrades, AP deployments, and infrastructure optimization.
- Facilitated outage triage coordination during network disruptions, driving faster resolution and structured post-incident analysis.

INTEL CORPORATION | Engineering Program Manager – Predictive Telemetry & AI Analytics Oct 2021 – July 2024

- Directed large-scale device health telemetry platform supporting real-time ingestion and analytics across distributed ChromeOS devices.
- Partnered with engineering to implement streaming pipelines and operational dashboards enabling proactive failure detection.
- Reduced manual device triage time by 30% through predictive diagnostics and anomaly detection models.
- Improved device reliability metrics by 15% through telemetry-based monitoring strategies.
- Led cross-functional coordination between engineering, SRE, and operations during production incident resolution.
- Established model governance including drift monitoring, validation reviews, and measurable reliability KPIs.
- Connected telemetry outputs to executive-level reporting to quantify operational savings (\$800K annually).

CISCO SYSTEMS | Technical Program Manager – Self-Optimizing Network (SON) Platform May 2019 – Sept 2021

Led development of a Self-Optimizing Network (SON) web application focused on RF performance optimization, automated configuration tuning, and enterprise network health monitoring.

- Directed end-to-end delivery of RF optimization software improving signal quality, coverage efficiency, and throughput performance across enterprise deployments.
- Led architectural transformation of legacy monolithic application into a scalable microservices-based platform, improving deployment agility and service resilience.
- Coordinated backend service decomposition, API gateway implementation, containerization strategy, and CI/CD enablement.
- Enabled real-time telemetry ingestion from network devices to support performance baselining and automated optimization logic.
- Partnered with engineering teams to implement event-driven communication between services for scalable alert processing.

- Established observability standards including centralized logging, health checks, service monitoring, and performance dashboards.
- Collaborated with operations teams to improve incident diagnostics through improved service visibility and telemetry instrumentation.
- Improved system scalability and reduced production defects through modular service isolation and automated regression validation.
- Supported RF planning, VLAN segmentation, and wireless performance optimization across enterprise customers.

POLYCOM (HP) | Technical Program Manager –VoIP & Embedded Communication Systems Nov 2016 – April 2019

Led development and integration of VoIP software platforms for enterprise IP phones and conferencing devices, supporting real-time voice communication and unified collaboration systems.

- Managed end-to-end delivery of VoIP software stack integration including SIP signaling, RTP media handling, codec management, and call control workflows.
- Coordinated firmware, hardware, and software teams to enable seamless integration across IP desk phones and conferencing endpoints.
- Directed cross-functional integration of Polycom VoxBox voice collaboration platform, ensuring interoperability with enterprise VoIP infrastructure.
- Led system-level validation of call setup, session management, and voice quality metrics (latency, jitter, packet loss).
- Partnered with QA and network engineering teams to troubleshoot production VoIP issues impacting call stability and device registration.
- Oversaw REST/SOAP API integrations enabling device provisioning, remote configuration, and monitoring.
- Improved validation efficiency by 25% through automation frameworks for regression testing of VoIP call flows and firmware releases.
- Ensured interoperability with enterprise call managers and unified communications platforms.
- Facilitated root cause analysis of signaling failures, codec mismatches, and network performance-related call drops.
- Drove release governance for VoIP firmware updates, ensuring high availability and minimal production disruption.

CISCO SYSTEMS | Project Lead – RMS Web Application (4G/5G Call Processing) Aug 2013 – Nov 2016

Managed development of RMS (Resource Management System) web application supporting 4G and 5G mobile device call processing workflows and telecom infrastructure operations.

- Led cross-functional teams delivering web-based system handling high-volume mobile call session processing and device state management.
- Coordinated integration with telecom network components supporting LTE and early 5G infrastructure environments.
- Supported real-time event handling and session lifecycle management across distributed services.
- Partnered with engineering teams to ensure performance optimization for high-throughput mobile traffic scenarios.
- Facilitated production issue triage impacting mobile device call handling and service reliability.

- Drove improvements in system performance, reducing latency in call state transitions and resource allocation.
- Oversaw API integrations and backend services enabling device monitoring and configuration management.
- Supported root cause analysis of network performance and signaling issues across telecom environments.
- Ensured reliability of critical telecom workflows through structured testing, release governance, and operational readiness reviews.

TE CONNECTIVITY (Tyco Electronics) | Software Engineer – EMS/NMS Web Applications & Network Device Management

2007 – 2013

Led development of Element Management Systems (EMS) and Network Management Systems (NMS) for managing SNMP-enabled telecom and broadband devices including WiMAX, DSL, and SONET infrastructure components.

- Designed and developed web-based EMS/NMS applications supporting remote monitoring, configuration, and fault management of network devices.
- Implemented SNMP-based device communication (traps, polling, MIB management) for real-time device telemetry and event handling.
- Built performance and fault management modules tracking alarms, threshold breaches, and device health indicators.
- Supported management of WiMAX base stations, DSL aggregation devices, and SONET transport systems.
- Developed backend services for device discovery, topology mapping, and network inventory management.
- Enabled trap processing and alarm correlation workflows to reduce duplicate alerts and improve operational visibility.
- Partnered with field engineering teams to troubleshoot connectivity, provisioning, and protocol-level issues.
- Supported configuration management workflows for firmware upgrades, remote provisioning, and device parameter updates.
- Led root cause analysis for performance degradation across broadband and transport network layers.
- Contributed to protocol-level validation across Layer 2/Layer 3 networking and SONET transport architecture.

EDUCATION

MS in Artificial Intelligence & Machine Learning – Liverpool John Moores University

Post Graduate Diploma in Data Science – IIIT Bangalore

B.Tech in Electrical & Electronics Engineering

CERTIFICATIONS

PMP – Project Management Institute

Generative AI – Microsoft Azure OpenAI
